

# Perceptual Speed Index

## Overview

Perceptual Speed Index is a page load performance metric that shows you how quickly the contents of a page are visibly populated. The lower the score, the better.

## Recommendations

To lower your Speed Index score, you need to optimize your page to visually load faster. Two good starting places are:

- [Optimizing Content Efficiency](#).
- [Optimizing the Critical Rendering Path](#).

## More information

Lighthouse uses a node module called [Speedline](#) to generate the Speed Index score.

For more information on the algorithms and methodologies behind Speed Index, see [Speed Index](#).

The target score is computed by a cumulative distribution function of a log-normal distribution. Check out the comments in the [source](#) of the audit if you need to know more.

## Feedback

Was this page helpful?

YES

NO

Great! Thank you for the feedback.

Sorry to hear that. Please [open an issue](#) and tell us how we can improve.
