

# DOMTokenList Validation Added in Chrome 50

By Sam Thorogood

Evangelises Chrome and the mobile web in the Developer Relations team at Google.

In Chrome 50, you'll be able to check the support of options for some HTML attributes that are backed by `DOMTokenList` instances in JavaScript. Right now, these places are:

- `iframe` sandbox options
- link relations (the `rel` attribute, or `relLink` in JavaScript)

Let's show a quick example:

```
var iframe = document.getElementById(...);
if (iframe.sandbox.supports('an-upcoming-feature')) {
  // support code for mystery future feature
} else {
  // fallback code
}
if (iframe.sandbox.supports('allow-scripts')) {
  // instruct frame to run JavaScript
  // NOTE: this is well-supported, and just an example!
}
```

As the list of supported options grows and changes, you can use feature detection to perform the correct actions for your web applications.
