

Options of a PushSubscription

By Matt Gaunt

Matt is a contributor to WebFundamentals

When a `pushsubscriptionchange` event occurs, it's an opportunity for a developer to re-subscribe the user for push. One of the pain points of this is that to re-subscribe a user, the developer has to keep the `applicationServerKey` (and any other `subscribe()` options) in sync between the web page's JavaScript and their service worker.

In Chrome 54 and later you can now access the options via the `options` parameter in a subscription object, known as PushSubscriptionOptions.

You can copy and paste the following code snippet into simple-push-demo to see what the options look like. The code simply gets the current subscription and prints out `subscription.options`.

```
navigator.serviceWorker.ready.then(registration => {  
  return registration.pushManager.getSubscription();  
})  
.then(subscription => {  
  if (!subscription) {  
    console.log('No subscription ☹️');  
    return;  
  }  
  
  console.log('Here are the options 🐼');  
  console.log(subscription.options);  
});
```

With this small piece of information you can re-subscribe a user in the pushsubscriptionchange event like so:

```
self.addEventListener('pushsubscriptionchange', e => {  
  e.waitUntil(registration.pushManager.subscribe(e.oldSubscription.options)  
    .then(subscription => {  
      // TODO: Send new subscription to application server  
    }));  
});
```

It's a small change, that will be super useful in the future.
