

Element ARIA Attributes Are Valid And Not Misspelled Or Non-Existent

Overview

Misspelled or nonexistent ARIA attributes may be preventing the screen reader from properly understanding the current state of a widget. This could make the page unusable to users who rely on screen readers.

See [Introduction to ARIA](#) for more information.

Recommendations

Below the audit, Lighthouse displays something like `1 element fails this test`. The number varies depending on how many elements are failing. Click this label to expand the list. You can find each element in your DOM by running the `$()`, `$$()`, and `$x()` functions from the Chrome DevTools Console.

To find each listed element's invalid attribute names:

1. Note the `role` and `aria-*` attributes of the element.
2. Go to [Definition of Roles](#).
3. Go to the page for this element's `role`.
4. Check the actual attributes on the element against the supported attributes, as listed in **Required States and Properties** and **Supported States and Properties**.

More information

This audit is powered by the aXe Accessibility Engine. See [ARIA attributes must conform to valid names](#) for more information.

Feedback

Was this page helpful?

YES

NO

Great! Thank you for the feedback.

Sorry to hear that. Please [open an issue](#) and tell us how we can improve.
