

# Time to Interactive

## Overview

Page load is a key aspect of how a user perceives the performance of your page. See [Measure Performance with the RAIL Method](#) for more information.

This audit identifies the time at which a page appears to be ready enough that a user can interact with it.

## Recommendations

See [Speed Index](#) for more help on improving page load performance. The lower your Time to Interactive score, the better.

## More information

Time to Interactive is defined as the point at which layout has stabilized, key webfonts are visible, and the main thread is available enough to handle user input.

Note that this metric is in early phases and is subject to change.

## Feedback

Was this page helpful?

YES

NO

Great! Thank you for the feedback.

Sorry to hear that. Please [open an issue](#) and tell us how we can improve.
