Manifest's display Property Is Set

Overview

When your app is launched from the homescreen, you can use the `display` property in your Web App Manifest to specify the display mode for the app.

Recommendations

Add a `display` property to your Web App Manifest and set it to one of the following values: `fullscreen`, `standalone`, or `browser`.

```
{
  ...
  "display": "fullscreen",
  ...
}
```

See MDN's reference for the display property for more information on each of these values.

Check out Manifest Exists for a list of guides that teach you how to properly implement and test "Add to Homescreen" support in your app.

More information

Lighthouse fetches the manifest and verifies that the `display` property exists and that it's value is `fullscreen`, `standalone`, or `browser`.

The manifest that Lighthouse fetches is separate from the one that Chrome is using on the page, which can possibly cause inaccurate results.
