# Support for theme-color in Chrome 39 for Android

By Pete LePage

Starting in version 39 of Chrome for Android on Lollipop, you'll now be able to use the `theme-color` meta tag to set the toolbar color—this means no more Seattle gray toolbars! The syntax is pretty simple: add a `meta` tag to your page's `<head>` with the `name="theme-color"`, and set the `content` to any valid CSS color.

For example, to set the background to your favorite color or HTML5Rocks orange:

```
<meta name="theme-color" content="#db5945">
```

In addition, Chrome will show beautiful high-res favicons when they're provided. Chrome for Android picks the highest res icon that you provide, and we recommend providing a 192×192px PNG file. For example:

```
<link rel="icon" sizes="192x192" href="nice-highres.png">
```

Check out the theme-color here on HTML5Rocks as well as on the Web Fundamentals site, and be sure to check out the Add to home screen docs for more ways to make your site stand out.
