# Preview JavaScript values inline while debugging
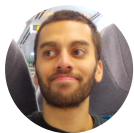

**By** [Umar Hansa](#)
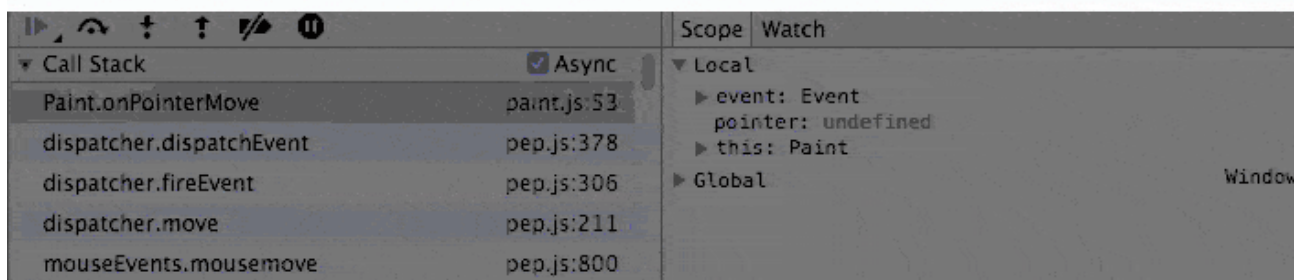

Umar is a front-end web developer

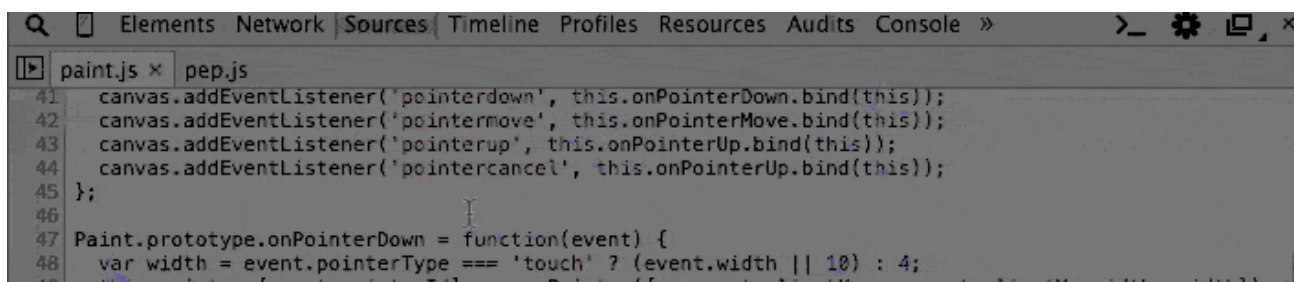

While debugging, you can preview the values of JavaScript variables at *that current point in time* - this even works with minified scripts (after you pretty print).

To enable this feature (if it's not already):

1. Go to DevTools settings (the cog wheel).
2. Check General > Sources > Display variable values inline while debugging.
